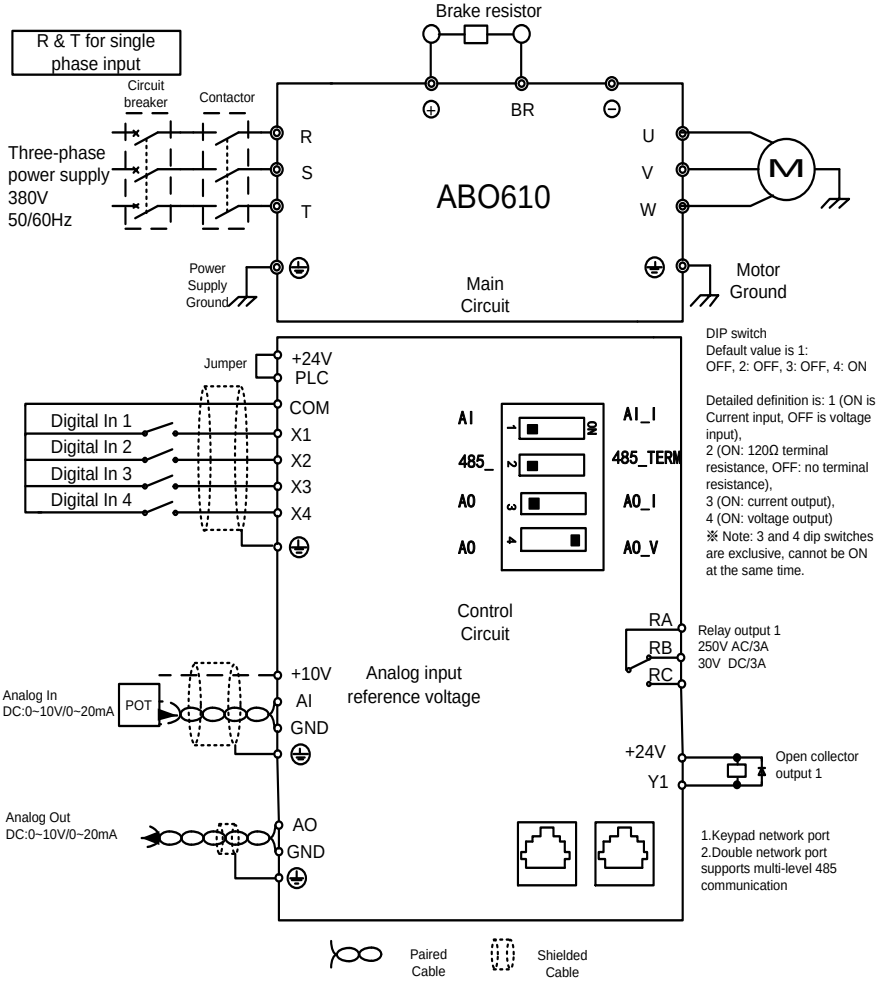
* The selection of the braking resistor needs to be determined according to the power rating of the motor in the actual application system, and is related to the system inertia, deceleration time, and the energy of the potential energy load, and user needs to choose according to the actual situation.

7. Wiring Diagram of ABO610



Main Circuit Terminals and Wirings

WARNING

- Wiring should be in strict accordance with this Quick Start Guide, otherwise hazard of electric shock or equipment damage exists.
- Since leakage current of the drive may exceed 3.5mA, for safety's sake, the drive

and the motor must be grounded so as to avoid hazard of electric shock.

- Be sure to perform wiring in strict accordance with the drive terminal marks. Never connect three-phase power supply to output terminals U, V and W. Failure to comply will result in equipment damage.
- Only mount braking resistors at terminals ⊕ and BR when need. Failure to comply will result in equipment damage.
- Signal wires should be far away from main power lines to the best of possibility. If this cannot be ensured, vertical cross-arrangement shall be implemented, otherwise interference noise to control signal may occur.
- If motor cables are longer than 50m, it is recommended output AC reactor be used. Failure to comply may result in faults.

Control Circuit Wirings

WARNING

- AC 220V signal is prohibited from connecting to other terminals than control terminals RA, RB and RC. Failure to comply may result in equipment damage.
- Shielded cables are highly recommended and the cables should be as short as possible in order to avoid any faults caused by interference.
